NaN

In computing, NaN, which stands for Not a Number, is a value or symbol that is usually produced as the result of an operation on invalid input operands. For example, most floating-point units are unable to explicitly calculate the square root of negative numbers, and will instead indicate that the operation was invalid and return a NaN result.

An invalid operation is not the same as an arithmetic overflow (which returns a positive or negative infinity). Arithmetic operations involving NaN always produce NaN, allowing the value to propagate through a calculation so that errors can be detected at the end without extensive testing during intermediate stages.

A NaN does not compare equal to any number or NaN. You can therefore test whether a variable has a NaN value by comparing it to itself, thus if $x == x$ gives false (0) then x is a NaN code.

How is a NaN created?

There are three kinds of operation which return NaN:

1. Operations with a NaN as at least one operand
2. Indeterminate forms
 - The divisions $0/0$, ∞/∞ , $\infty/-\infty$, $-\infty/\infty$, $-\infty/-\infty$
 - The multiplications $0 \times \infty$ and $0 \times -\infty$
 - The power 1^∞
 - The additions $\infty + (-\infty)$, $(-\infty) + \infty$ and equivalent subtractions.
3. Real operations with complex results
 - The square root of a negative number
 - The logarithm of a negative number
 - The tangent of an odd multiple of 90 degrees (or $\pi/2$ radians)
 - The inverse sine or cosine of a number which is less than -1 or greater than +1.

NaN in MagicPlot Tables

In MagicPlot NaN also is used to represent empty cells in tables.

Statistical functions ignores NaN values in tables.

NaN in Expressions

You can use a predefined constants NaN, nan or NAN in expressions to indicate NaN value.

Examples

Expression	Result
0^0	1
$0/0$	NaN
$\text{sqrt}(-1)$	NaN
$1/0$	Infinity
$-1/0$	-Infinity
